I have a query with a where clause and I'm wondering what's the difference between these two query: SELECT * FROM table_name WHERE variable = variable_value and SELECT * FROM table_name WHERE variable IS NOT NULL I guess in first case variable = variable_value always means variable must be nullable, while in second case it means that variable must be NOT NULL. Can someone explain? A: In SQL Server, IS NOT NULL is exactly the same as NULL = NOT NULL In other databases, it's more complicated and may be different (i.e. NOT NULL is defined in SQL, IS NOT NULL is an extension) In SQL Server, the comparison is only done with the literal value and not for implicit conversion to the data type of the column. For example: SELECT NULL = NULL The result is NULL because SQL Server checks if the left side and the right side are the same, and they are the same. SELECT NULL NULL The result is FALSE because the left side is NULL and the right side is NULL. The expression has no value and so is considered false. SELECT CAST(NULL AS INT) = NULL The result is NULL because both sides are NULL and the literal NULL is implicitly converted to the data type of the column. The resulting data type is therefore INT and so the comparison evaluates to TRUE. The present invention relates to power conversion apparatus, and more particularly to a battery charger system for providing an improved charging circuit for a battery that employs a feedback circuit for changing the charging rate in accordance with the actual charge level of the battery. The power conversion apparatus of the present invention finds particular utility in connection with automotive applications, but it should be appreciated that the disclosed concept could be readily adapted for other applications such as portable equipment. There are many different types of batteries, and thus battery

Then $\mu_n(A) = 1$. Intuitively this is very clear, and if you wanted to you could proceed by letting $m(A) = \sup_{x \in A} \{x\}$ be the measure of the set A and then proceed by induction. However, I'm not seeing how to show this algebraically. Any help or direction would be appreciated. A: Here's a more general result. If $A\subseteq\mathbb{R}^n$ and $f:A\to\mathbb{R}^n$ is a homeomorphism, then $\mu_n(A)=\mu_n(f[A])$. Proof: Since f is a homeomorphism, $f[A]$ is dense in $\mathbb{R}^n$. Hence, if $\mu_n(f[A])>0$, then by the density of $f[A]$, we have $\mu_n(A)>0$, which contradicts our assumption that A is dense. Thus, $\mu_n(f[A])=0$. Now, the result follows from the fact that $$\mu_n(A)=\mu_n\left(f[A]\right)=\ 2d92ce491b
