

wow.T-zs.com.com 4205705709Relating psychoacoustic and psychophysical analysis of the effective loudness. Recently we have shown that the acoustically mediated loudness of a pure tone can be defined as the intersection of an asymptotic psychophysical loudness function and a psychophysically estimated loudness function. In this paper we extend that study to include a loudness function for level-dependent auditory discomfort, derived from the discomfort loudness function. The psychoacoustic and psychophysical analyses were conducted in normal-hearing subjects, in order to relate the resulting loudness functions to the loudness of other sensation. The asymptotic loudness functions for both the effective and discomfort loudness levels were derived from a single set of loudness data, collected over a range of comfortable and discomfort levels. The loudness function for discomfort was derived from simultaneous estimates of the discomfort loudness function, collected for 20 normal-hearing subjects, together with the discomfort loudness function, derived from the discomfort loudness levels. The psychophysical function relating discomfort loudness to discomfort loudness was found to be well approximated by a power law. Both the discomfort loudness function and the discomfort loudness level were found to be inversely related to the loudness function for effective loudness. Based on these results, a new psychoacoustic theory of the loudness level-dependent auditory discomfort is proposed, and compared to other theories.Q: Cannot change static data member of a class using a constexpr function in a different class I am trying to change the data members of a class using a constexpr function. The following code does not compile. #include using namespace std; class Data { public: static int n, i, sum; }; int main() { Data::n = 0; Data::i = 1; Data::sum = 0; static int d(int l) { return Data::n += l; } constexpr Data::n = d(1); cout
