Portable Celestia is a space exploration application designed to display the night sky and planets and some of the other stars. The planets are rendered to give you an idea of how they would look on the sky as seen from Earth. It contains images and information that can be viewed by zooming in on the planets and stars. Space... how cool is that? A new way to see the stars, planets, the universe and everything else in between. The most accurate sky simulation tool available for Windows How often do we take time to sit back and contemplate all the things we don't know? It's something we all do from time to time and the more you do it the more it becomes a habit. But what if we could somehow make the journey to find out what lies beyond our own little world? This may sound like a really strange concept to many, but Celestia is a great first step. It is the most accurate sky simulation software that's available for the PC and it's so simple to use, you don't even need to go online to take advantage of all the information it offers. - Control of the simulation The app is very easy to use. It has a simple, yet elegant menu system. It does not have a huge amount of buttons and options which can be a bit intimidating for newcomers. With the help of the help button, though, there is plenty of information on the website and many videos, making it really easy to get to grips with the system. - Zoom in and out Celestia offers a feature to zoom in and out of the simulation. This is a must-have feature because when looking at the stars and the planets, you need to get as close as possible, usually you can't see any detail. With this ability, you can zoom in on different parts of the night sky in a number of different ways, offering an accurate view of the night sky, but without zooming all the way out. - Options Celestia has many different options that you can use to create an accurate view of the night sky. By default it will try to show the Moon, but you can adjust the settings to show the planets, stars, constellations and many other things. The Moon and stars will appear bigger and brighter, and you can even switch them off, depending on your preference. - Images The images are amazing. They are all real and they offer the best view of the night sky we have to date.

What's New In?

Very informative app Like most of the apps of this kind, the main idea is to offer individuals information about space, planet Earth, the galaxy surrounding it, and all the stars that are part of it. Thus, it's no surprise that this program attempts to offer brief but sensible information when zoomed in on any of the simulation's components. Things such as distance from the planet from a set point, the celestial body's radius, diameter, or phase angle will be displayed no matter the scenario. One can set bookmarks or other types of reminders if there is something important to note. Relax and take a space tour The most interesting aspect of this portable app is the fact that it allows one to tour the galaxy, observing a simulation of the passing of time, or traveling hundreds of millions of light-years between various objects situated in our galaxies. There is no doubt that this software can very well be fitted in any school schedule and lecture. It's easy to grab the attention of your class with a tool such as this one because it's fascinating to be able to cruise into space without actually having to fear for your life. The app allows for the main view to be split horizontally or vertically, depending on one's preference. Make sure you grab this app if you're a space aficionado and travel through time and the sheer nothingness of our galaxy to discover as much as possible about what lies beyond and what doesn't.
