The wide variety of available database formats has created a significant demand for any utilities that can assist users in effectively transferring information between different

servers. Supporting a wide variety of data containers, dbMigration.NET allows its users to quickly and selectively migrate information. Transfer entries between two databases All in all, the program is compatible with 17 types of databases, including common choices, such as SQL, MySQL, Access or Oracle servers, as well as more 'exotic' items like Vertica, NuoDB or Teradata containers. This setup covers

most common data migration needs and another strong point is the highly accessible nature of the application. In essence, the program requires four essential steps to transfer information: select source database, choose target server, define the information that is to be migrated and click on the "Execute" button. Copy only selected entries Indeed, since some server-related tools can be quite complicated and user-

unfriendly, the highly accessible layout is to be lauded. Simple checkboxes are used to indicate which data is migrated from the source server and a preview panel allows one to assess the final results. A source code dump is also created, allowing tech-savvy users to ensure final results are on par with their expectations. Once satisfied with the initial parameters, a simple click on the "Execute" button is enough o start the migration,

point at which an informative progress bar estimates the duration of the transfer. An overall powerful tool for migrating table data between two servers Summing up, dbMigration.NET is a practical solution for anyone who regularly and concurrently uses databases of different types. The lightweight program can be employed to quickly transfer data between common and less common information servers

such as SQL, MySQL, Vertica, NuoDB, Teradata, Access or Oracle items. dbMigration.NET is a powerful software for users who work with multiple database types. It helps them migrate information between any available database like Access, SQL Server, MySQL, MongoDB and more. This software effectively migrates data between two servers in just a few steps. Key features: • Very easy user interface • 17 supported

databases • Export.json file with migration parameters • Copy only selected entries • Run server.exe and select the database • Upgrade to the newest version has no effect on the saved data. • Provides all in one solution • Through JavaScript code transfers data to the other server • User-friendly interface • Extremely easy to use Powerful software for a wide array of databases Choosing dbMigration.NET for migrating

information from SQL, MySQL, Oracle, Access, Vertica, MongoDB, NuoDB, Teradata and other databases is a very wise decision. The lightweight program effectively allows users to transfer data between different servers. An intuitive interface is combined with a configurable preview panel, which permits users to assess the results before initiating the migration. As always, the program requires selecting a

source server as well as defining the tables and columns that are to be transferred. The target database is automatically selected by default, but can also be explicitly defined. The main steps of migration execution follow automatically, without further user input.
