DeepS3D is a 3D graphics engine for use in games and other applications. The engine is mostly written in C++ but also offers several scripting languages. It can be used to render your own objects on the screen with almost no limitations (except CPU/RAM constraints). DeepS3D is a cross-platform library that supports the Windows, Linux and Mac OSX. It uses a custom (but user friendly) OpenGL-like window manager, so you can use it with DirectX, OpenGL, SDL, Cocoa, GTK+, Java or X11. DeepS3D comes with its own scripting language, inspired by Lua, which was chosen for its ease of use and its ability to integrate with the C++ code. The scripting language was designed to be simple, with a limited but complete set of operators, both low-level and high-level. It supports several operations (rotation, translation, scaling, projection, pixel access, drawing primitives, and many others), and the way they are performed can be scripted. DeepS3D includes a video output system that uses both OpenGL and SDL, with very little or no work on your side. This makes it the only solution for developers to render high quality and near-real time video in a cross-platform environment (with OpenGL and SDL, of course). DeepS3D is modular in its design and offers an extensive object model, for example, the V-Tree and its derivative algorithms, to enable you to write complex scene or graphical user interfaces. New in this Release: - Added support for the SSE instruction set, allowing for faster rendering - Added Basic 3D scene rendering - Added support for 64 bit integer data types - Some bugfixes SsoDb is an open-source, client/server database that supports many DBMS including MS SQL Server, MySQL, Oracle, DB2, PostgreSQL, Interbase, OpenBase, Oracle 8, DB2 6.5, and Postgres 7.3. All databases which support ODBC 3.0/3.1 will work with SsoDb. The SsoDb Client/Server enables you to access the database as a single client on your own machine, or as a client on another machine with the server. The client/server relationship is optional and the SsoDb can be used with a single client if desired. Several databases can be used with SsoDb. ODBC supports SsoDb using ODBC

See moreTheoretical study on the photophysical and photochemical properties of a series of Al/Zn-phthalocyanine chromophores. The ground state geometries of a series of Al/Zn-phthalocyanines (AlPc(n)ZnPc(n+1)) were studied using density functional theory (DFT), while the excited state properties were investigated by time-dependent density functional theory (TDDFT). The geometry optimization was performed using density functional theory (DFT) at the B3LYP level, with the Lanl2DZ basis set for the electron-donor atoms, and 6-31++G(d,p) basis set for the heavy atoms. The excited state properties were investigated using the time-dependent density functional theory (TDDFT) with the B3LYP/6-31++G(d,p) level of theory. The results show that the absorption and emission wavelengths, as well as the band gaps are dependent on the Al/Zn ratio. The LUMO level is mainly distributed at the π-system of the phthalocyanine unit. The obtained theoretical results showed that the position of the highest occupied molecular 1d6a3396d6
