Photoshop is a graphics design program developed by Adobe Systems. Its primary use is in the creation of 2D images such as photographs and illustrations. It also includes many

features to handle complex tasks in the production of photographs. Photoshop is often used as a template for other image editing software such as Adobe Photoshop Elements. Photoshop Elements was introduced in 2005 and has proved to be a very popular upgrade and alternative to Photoshop. The latest version was released in September 2017 with over 57 million users world wide. The key feature of Photoshop Elements is that it was designed with the home user in mind.

Most of the features that the professional graphic designer relies upon to perform complex tasks have been simplified and made easier to use by the average user. With Photoshop Elements and many of its applications, designing, enhancing, and posting images is simpler than ever. With the numerous photo editing options in Photoshop Elements, anyone can create stunning images, even if they have little or no experience in creating them. The two basic modes for

Photoshop Elements are Image Editing and Photo Editor. The first mode includes simple editing features, while the second one has more advanced tools to enhance, add, and enhance most images. Users can select from among 200 filters, adjust settings such as contrast, clarity, edge sharpening, and more. They can crop, resize, and manipulate the colors of any image, even those with mixed color filters. Willpower Photoshop Elements provides intuitive tools and a user-

friendly interface. It is a graphics design program designed for amateur and professional users. Its intuitive user interface means that it is easy to use. Photoshop elements is easy to use and requires no prior knowledge of a graphics program. Photoshop Elements is very easy to understand. An image of a butterfly in Photoshop Elements can be opened, seen, duplicated, edited, saved, or even printed directly from the program. Popularity

Q: Django/Python check if a variable has been set in the template I am trying to find out in the template if a variable has been set yet. I tried this: `{% if request.POST.pk %} {{ object.pk }} {% endif %}` But this does not work: Request object is not available A: You could write a custom template tag for this. Something like:

```
@register.filter(name="is_set") def is_set(default, obj): try: return default
```

and `obj.__get__(obj)` except
AttributeError: return default Then in
your template `{% load my_custom_tag
%} {% if object.pk is_set %} {%
endif %}` You can download the

OTTAWA — The Syrian civil war has likely killed about half of the roughly 300,000 people who have died there since the conflict began in 2011, new research has found. The Canadian Institute for Advanced Research study estimates that at least 55,000 people

have been killed in the 15-month conflict, and the total death toll now sits at roughly 315,000. We apologize, but this video has failed to load. tap here to see other videos from our team. Try refreshing your browser, or

Researchers say they have no way of knowing how many have died since the outbreak of conflict, as world leaders failed to agree on a ceasefire and

destroyed key records. But the Institute estimates that 7,000 people are being killed per month in the fighting, with major cities in the country being the hardest hit. The most recent highpoint of the fighting was Aleppo, where 300,000 people have been displaced. ◆?

Q: Gradle: alternative to "doFirst()" when defining how multiple application artifacts are added to the

classpath? Using Gradle, I have some of my Android library projects that depend upon libraries that have a "gradle.properties" file in their "libs" directory that specify a path for where they are located in their dependencies (like, say, libs/a.jar). I defined these properties in my Android library modules using the "doFirst()" method, like this:

```
android { // Other settings
doFirst { println "Adding libs directory
to the classpath..."
project.buildDir.absolutePath =
```

```
outputDir System.properties {  
  props.replace("$INSTALL_DIR",  
  project.buildDir.absolutePath) } } }
```

As long as everything gets rolled into the "outputDir" path, it seems to work fine. But Gradle is adding this,

amongst other things, to the classpath:

-..libs/dependency.jar (copied from \$INSTALL_DIR)

-..libs/dependency.jar (copied from \$INSTALL_DIR)

-..libs/dependency.jar (copied from \$INSTALL_DIR) ... where it seems it

should just be reading the file and then appending the path. That is, if I instead was to do something like:

```
android { //
Other settings doLast { println
"Adding libs directory to the
classpath..." System.properties {
props.replace("$INSTALL_DIR",
project.buildDir.absolutePath) } } }
```

It would work, as far as the classpath is concerned, but of course I wouldn't get the dependency.jar files in my app/libs directory, because that is defined by the dependency.jar file. So, it seems

that doFirst() does not have an option
to just write a file to the
